

The background features a light beige color with white line art. A jagged line runs across the top and bottom of the image. In the top left, there is a blue line graph with three points. In the top right, there is an orange line graph with four points. In the bottom right, there are three gold Bitcoin icons and three gold stars. In the bottom left, there is a blue and green mine cart filled with gold coins and two gold stars.

DODO

Decentralized Exchange
Group #2

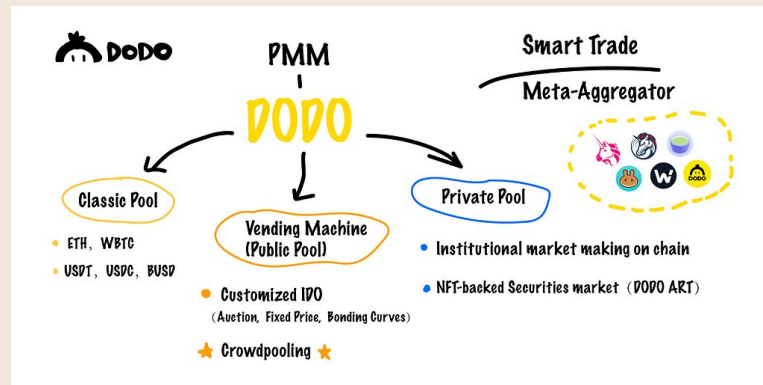

What is DODO?

- **DODO is a decentralized exchange built on Ethereum and Binance Smart Chain that aims to make DeFi liquidity more accessible.**
- **Unlike many other DEXs, which use an automated market maker algorithm, DODO uses its own proactive market maker algorithm.**

Unique Features

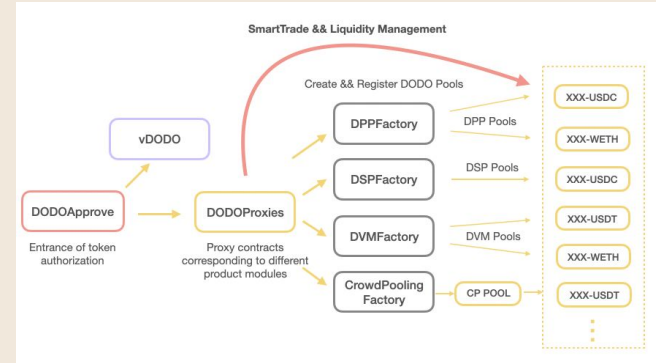

- DODO's product includes SmartTrade, which facilitates trades between tokens on the same network.
- It also provides traders with the best prices by intelligently finding the best order routing from aggregated liquidity sources.

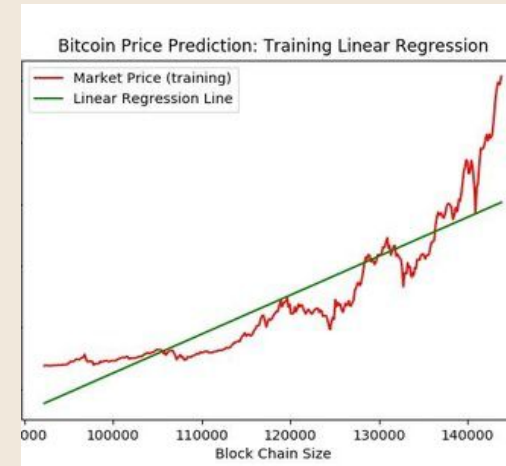

PMM

Traditional

- The typical market making formula stipulates that the price of the base token rises linearly as the number of base tokens that have been traded increases.
- Firstly, it is over simplified as it doesn't reflect the uneven distribution of liquidity caused by the concentration near the mid price.
- Secondly, once the price goes above or below certain thresholds, the linear model returns a liquidity of zero even though there is still liquidity at that price.

However, the linear model has its limitations

PMM

- **The DODO team developed the nonlinear proactive market making algorithm entirely in-house to provide more favorable pricing through a mechanism that mimics human trading, is highly flexible, and is optimized for on-chain transactions.**

■ PMM Overview

Active Market Maker Algorithm

DODO uses the original PMM algorithm to provide liquidity.

PMM is an inventory management strategy. When the quantity of an asset becomes low, the PMM algorithm automatically increases the price quoted for this asset in anticipation of buying back the missing inventory from the market.

A simple example

Next we will use a simple example to illustrate how PMM works. (The following example numbers are not exact, but are just to help you understand how the algorithm works)

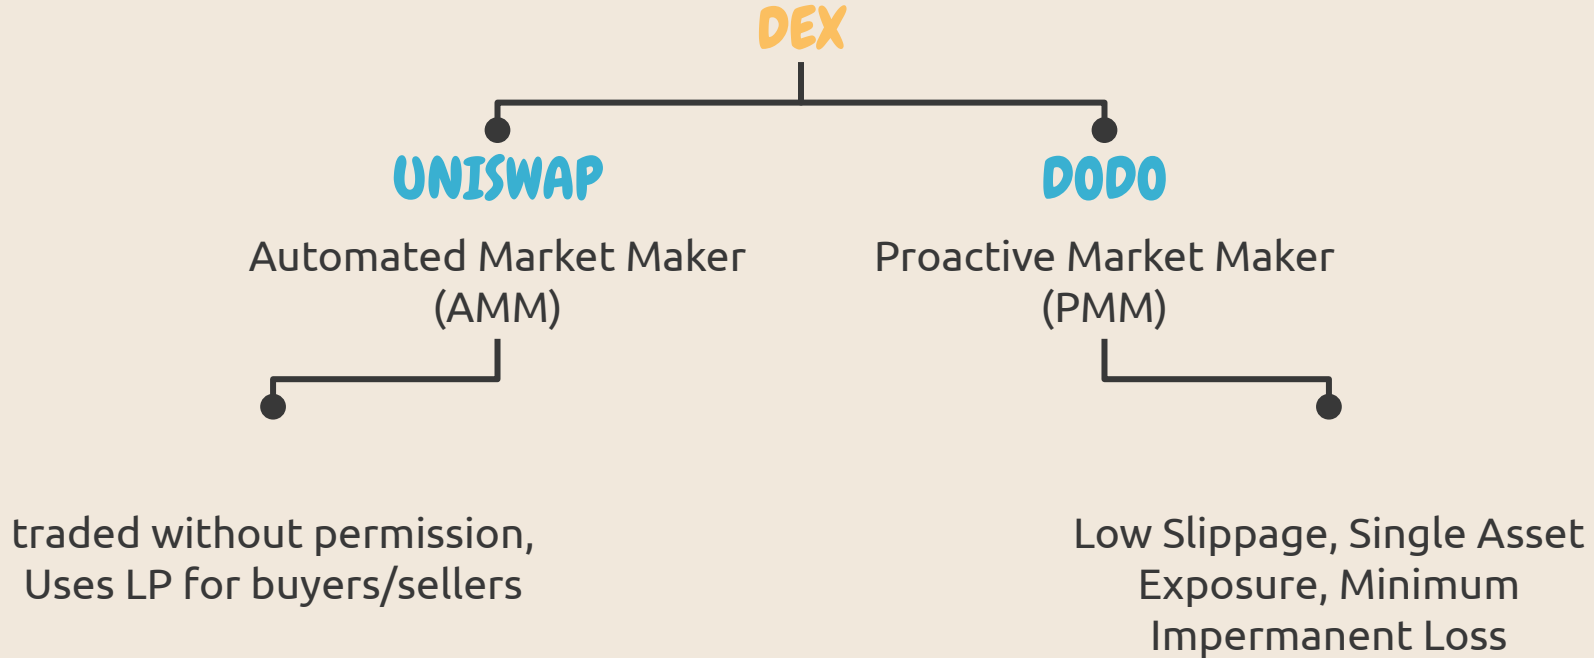

Peter's boss gives him \$100 and 10 apples. There are people in the market who buy and sell apples, and Peter has to satisfy these people's buying and selling needs with the inventory he has on hand. In more technical terms, this is "providing liquidity to the apple market".

The owner tells Peter that the apples are about \$10 each and then goes home to rest, leaving Peter to wait for the users above in the market. Someone buys an apple from Peter, Peter adds a little price to it and sells it to him for \$12. The \$2 is the so-called "slippage". At this point Peter's inventory is \$112 and 9 apples. That is $+\$12 - 1 \text{ apple}$.

Peter automatically places a pending order at \$11 (slightly above market price), expecting to buy back an apple as soon as possible to make up the shortfall. Soon Peter buys back the apple for \$11, leaving Peter with \$101 and 10 apples in stock, or $+\$1$ and 0 apples. Although it cost \$1 more, the extra \$2 received through the slippage was enough to make up for it, and Peter helped his boss make a net profit of \$1.

How to store cryptocurrency

User Experience

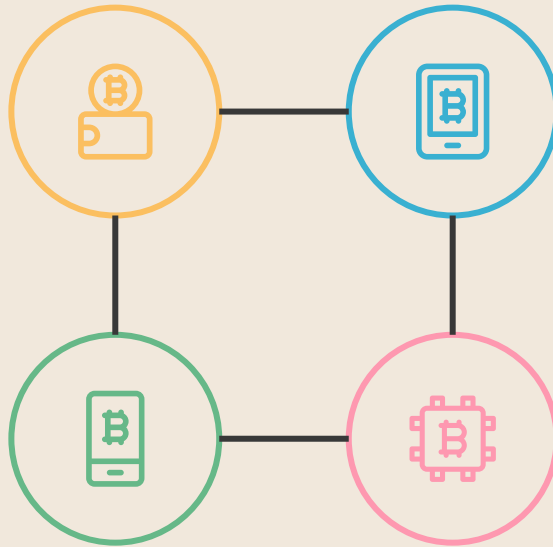

Services Provided

Liquidity Staking

not required to
provide a trading pair
when adding liquidity
(80% of revenues)

Token Swap

Easily swap tokens
across multiple chains

Crowdpool & Token Creation

Raise funds for
upcoming
project/token

COMPUTERS

Saturn is a gas giant
and has several rings

Crowdpooling

- Enables projects to kick-start liquidity
- Distribute tokens in an equal opportunity way
 - No exposure to bot interference
- Fundraising is FREE
 - Why?
 - Listing fee for token creation is very cheap (.02ETH)

NFT's

Trade NFT

Ability to buy/sell
existing NFT's

Create/Issue NFT

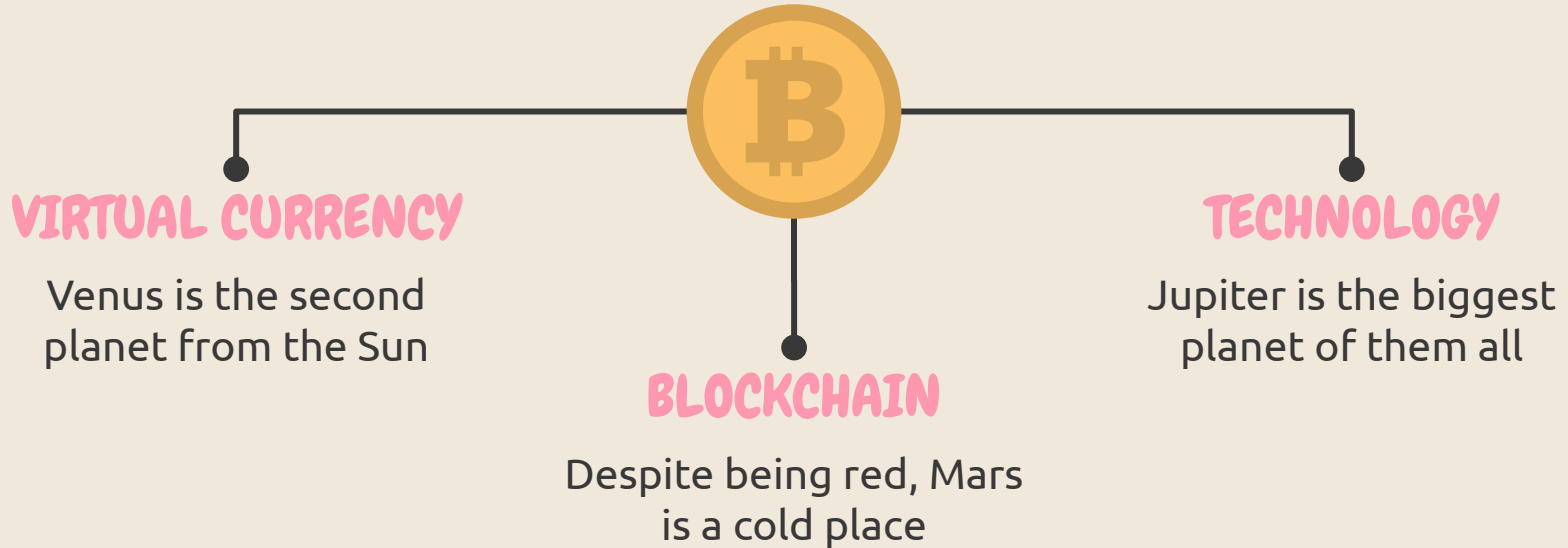

No code implementation,
provide name/quantity

Cryptocurrency: meaning and definition

VIRTUAL CURRENCY

Mercury is the closest planet to the Sun and the smallest one in the Solar System—it's only a bit larger than the Moon

BASED ON BLOCKCHAIN

Venus has a beautiful name and is the second planet from the Sun. It's hot and has a poisonous atmosphere

DISTRIBUTED LEDGER

Despite being red, Mars is actually a cold place. It's full of iron oxide dust, which gives the planet its reddish cast

Cryptocurrency today infographics

About cryptocurrency

01	VENUS	Venus is the second planet from the Sun
02	JUPITER	It's the biggest planet in the Solar System
03	SATURN	Despite being red, Mars is a cold place
04	NEPTUNE	Saturn is a gas giant and has several rings
