

Using Blockchain to solve Climate Change

Niklas Lee, Ben Lichtenstein

Carbon Markets

- Carbon markets effectively work to price carbon and greenhouse gas emissions through trading **carbon offsets**

Carbon Offsets → One carbon offset represents one (1) ton of CO₂ removed from the atmosphere. Companies remove this CO₂ and sell the offset to a company that is unable to remove their CO₂ output

Why Carbon Markets?

- ☀ We need to be carbon neutral by 2050
- ☀ Carbon offsets represent an efficient way to do this without hindering economic development

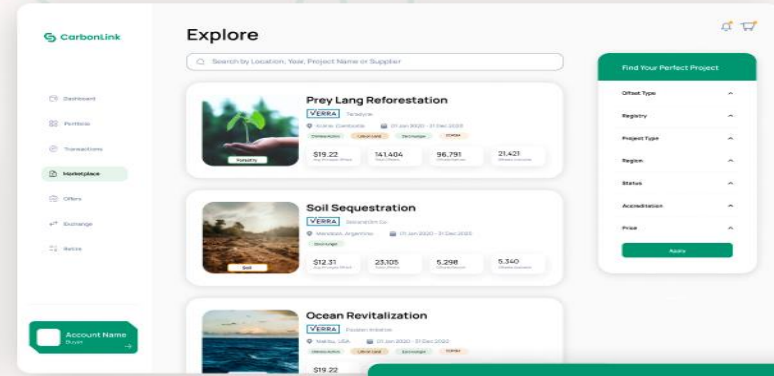

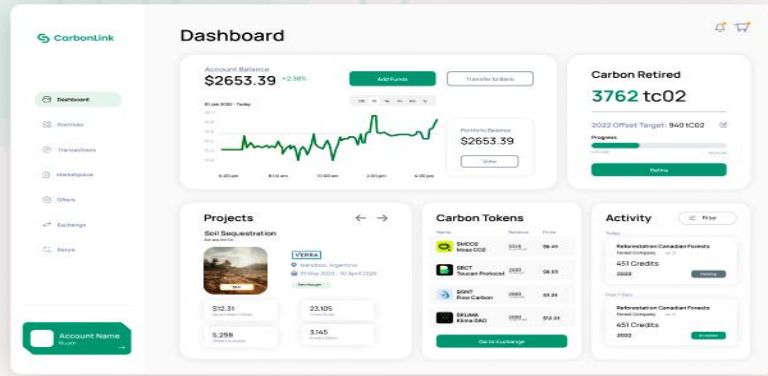

Airlines
